

ENVAULT AUDIT & CONTROL

USE CASE:

In many companies sharing business critical data is still a challenge, especially when the confidentiality needs to be maintained.

For example, efficient collaboration between the members of the board requires sharing confidential material. The members represent different organizations, thus they are out of the reach of the controls defined by the company's current Information Security Policy. As a result, the information is printed, or for example HW Encrypted memory stick is used, or even a public cloud is used for sharing. In any case the process is awkward, un-safe and not in full control.

Envault's solutions enable **sharing data confidentially also with 3rd parties**, the control over the data remains with the company and every action is included in to a **full Audit Trail**. No special hardware or actions are needed, the solution works transparently on the background.

In nutshell:

- *Built-in Audit Trail and Central Control for Data and Device management*
- *Protection for External and Internal Devices (hard drive, folder), Email, Cloud Storage*
- *Efficient, easy-to-use protection (AES256 + Envault = Double Guard Technology)*
- *Hosted or On-site*

Full Audit & Control eliminates business critical data leakages and provides tools for companies to identify risks, prevent and discover miss usages.

“SHARING BUSINESS CRITICAL DATA CONFIDENTIALLY”
