

ENVAULT SERVER STORAGE ENCRYPTION

CENTRALISED ENCRYPTION, REMOTE CONTROL AND AUDIT OF CONFIDENTIAL DATA ON DISK SERVERS

Envault™ Server Encryption solution protects your company confidential information on disk servers. Envault protection agent is installed on the server, after which the protection agent encrypts the data to the highest security level classified as AES-256 algorithm. A separate key management server stores the keys separately from encrypted data thus making physical access to the disc or the server is not enough to open encrypted data.

Envault™ Server Encryption is ideally suited for improving the security of, for example, outsourced disk servers. Only specified persons are able to access protected data and a separate Audit Trail logs and alarms allow usage monitoring.

“ FLEXIBILITY & EASY OF USE: CONTROL AND VISIBILITY LIKE NEVER BEFORE

SYSTEM REQUIREMENTS

Envault™ Server Storage Protection server:
Microsoft Windows Server 2012/2016.or
Linux server

Fragmentvault™ server

Hosted or On-site Windows (Server 2012/2016) or
Linux.
